Test Results: Genotype of your dog is Normal/Clear.

Risk for developing prcd-PRA: This dog will never develop the prcd form of PRA (progressive rod-cone degeneration form of Progressive Retinal Atrophy). Note that PRA in Golden Retrievers appears to consist of at least two different genetic defects. Because only a small number of PRA affected Golden Retrievers have been tested so far, it is not possible to estimate the frequency of prcd-PRA among PRA affecteds of this breed. A Golden Retriever of known status for prcd-PRA could still be at risk for another, as yet unidentified form of PRA.

Significance for breeding: Genetically Normal/Clear dogs can be bred to any dog and will produce no pups affected with the prcd form of PRA.
